

2. Testing Your WorkBee

Written By: Ryan Christy

INTRODUCTION

Please read before proceeding to avoid damaging the controller and voiding your warranty

- 1. Avoid connecting the Controller via USB when you do not need to. (Except when instructed to in the guides)
- 2. Always unplug the WorkBee Power Supply before connecting the USB Cable.

Step 1 — **Testing The Emergency Stop**

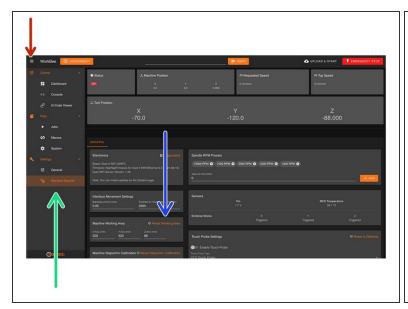

- The Emergency Stop has been pretested by Ooznest. But you should test it again.
 - First insure the machine is switched on, and have WorkBee Control open on your web browser.
 - Press the Emergency Stop.
 - You should loose connection to WorkBee Control.
 - If you do not loose connection make sure the USB Cable is not plugged in.
 - If you still do not loose connection, stop here and Contact Us.
 - With the connection lost, unlatch the Emergency Stop.
 - After a few seconds WorkBee Control should reconnect.

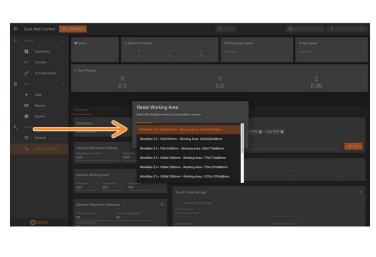

Step 2 — **Axis Movement Direction**

- If looking at the machine from the front the axis motion is:
 - The X-Axis is positive towards the right.
 - The Y-Axis is positive towards the back.
 - The Z-Axis is positive going up.

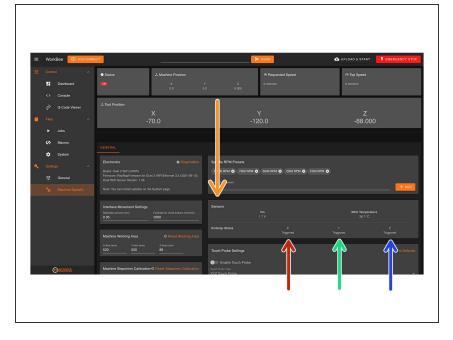

Step 3 — Configure Machine Size

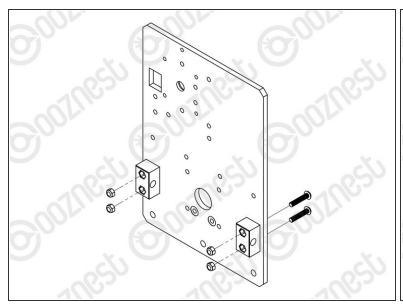

- In WorkBee Control open the Navigation Menu
 - Under 'Settings', press 'Machine Specific'
 - Under the Panel called 'Machine Working Area' press 'Reset Working Area'
 - Under the 'WorkBee Model' dropdown select your machine size.
 - (i) Yours is a Z1+ Model
 - Confirm by pressing 'Yes'
 - (i) The machine is now configured. No restart required.

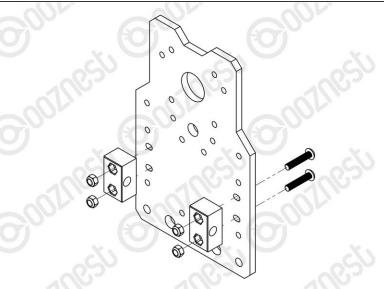

Step 4 — Test Limit Switches

- On the same page, under the Panel called 'Sensors' we can test the Limit Switches.
 - Activate the X-Axis limit switch with your finger and hold.
 - The Endstop Status should change to 'Triggered'
 - It is normal for there to be a delay between pressing the limit switch and the status being updated. Please do not be concerned, the board will stop the motor instantaneously.
 - Repeat this procedure for the Y-Axis Limit Switch.
 - Repeat this procedure for the Z-Axis Limit Switch.
- If any do not behave as intended do not proceed with this guide, please Contact Us.

Step 5 — Tighten Nut Blocks

- At this point in time, the Nut Blocks on X & Y-Axis Carriages should be loose.
 - Tighten these.
 - Do not over tighten them, they will need to be undone shortly.

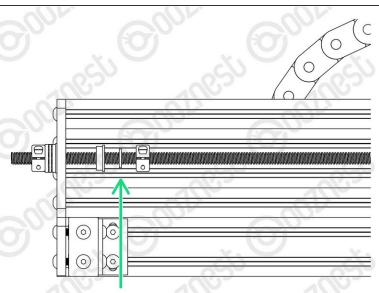

Step 6 — Test Homing

- When the machine homes, it will raise the Z-Axis, and then move the X and Y-Axis to the far right-hand corner.
 - If any of the points below do not behave as explained do not proceed with this guide, please Contact Us.
 - Press Home Z. The Z-Axis should raise upwards, bounce once on the limit switch, and then stop.
 - Press Home X. The Z-Axis should home like the previous. The X-Axis should then move towards the right, bounce once on the limit switch, and then stop.
 - Press Home Y. The Z-Axis should home like previous. The Y-Axis should then move towards the back, bounce once on the limit switch, and then stop.
 - Press Home All. The Z-Axis should home like previous. Then the X and Y-Axis should home like previous.

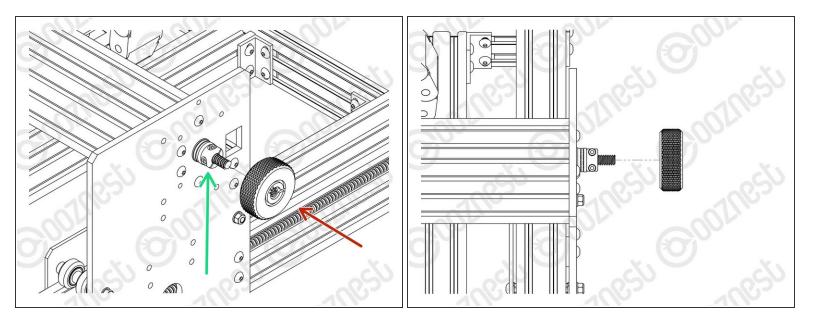

Step 7 — Lead Screw Tensioning - Part 1

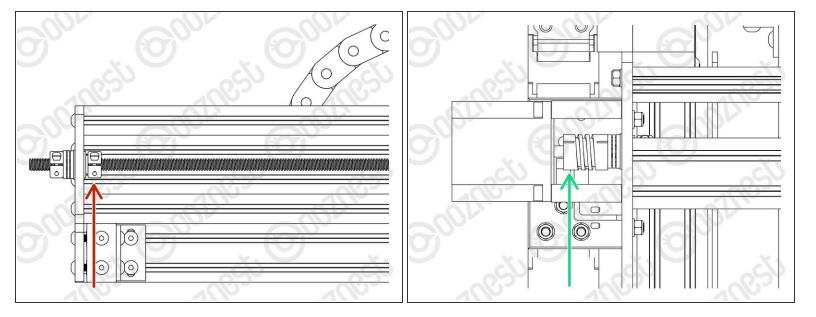

- Home the machine and use the jog buttons to move the machine roughly into the middle of the working area.
 - Leave the machine powered on so the Stepper-Motors stay locked.
- Loosen all the Nut-Blocks on the X & Y-Carriages.
- Loosen the Clamping-Collars that are on the inside channel of Extrusion-E/F on the X & Y Axes.
 - Move all Flanged-Radial-Bearings, Rubber-Bushings & Clamping-Collars away from the plates.

Step 8 — Lead Screw Tensioning - Part 2

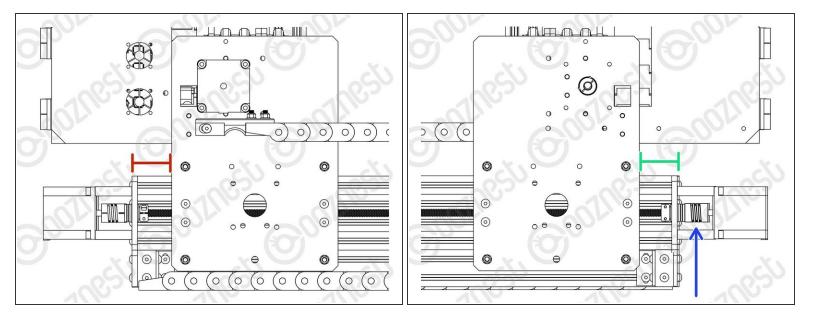

- Starting with the X-Axis, thread on the Tensioning-Knob until it is up against the Clamping-Collar.
 - Then loosen the same Clamping-Collar.
 - Turn the Tensioning-Knob clockwise, you will feel the Lead-Screw tension build.
 - Keep turning until the Stepper-Motor clicks over.
 - Keep turning, just before the point that the Stepper-Motor clicks over is the correct amount of tension for the Lead-Screw.
 - While at this point of tension, tighten the Clamping-Collar that is next to the Tensioning-Knob.
 - Remove the Tensioning-Knob.
- Repeat all the above for both Lead-Screws on the Y-Axis.

Step 9 — Lead Screw Tensioning - Part 3

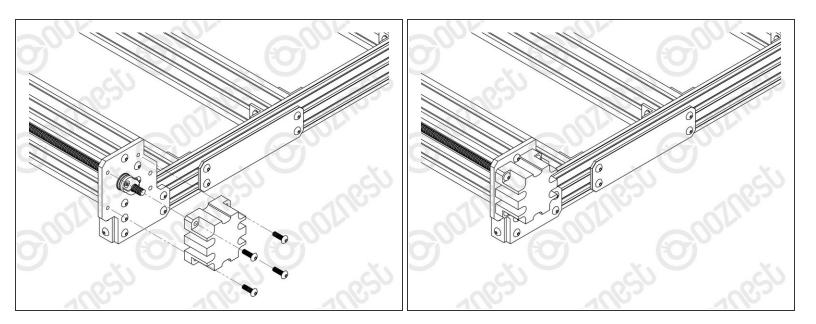

- Once all 3 Lead-Screws are tensioned, put back the Flanged-Radial-Bearings, Rubber-Bushings, and Clamping-Collars that are on the inside channel of Extrusion-E/F on the X & Y Axes.
 - The Clamping-Collars only need to be pushed lightly up against the Rubber-Bushings & Flanged-Radial-Bearings.
- We need to release any tension inside the Flexible-Couplers.
 - On the Stepper-Motor side of the X & Y-Axis Flexible-Couplers completely <u>loosen</u> the grub screws and clamping bolts.
 - Then completely <u>tighten</u> the same grub screws and clamping bolts.
 - Make sure you do this to the Stepper-Motor side of the Flexible-Coupler.
 - 1 If you loosen the Lead-Screw side you will loose all tension in the Lead-Screws and you will need to redo it.
- Tighten all the Nut-Blocks on the X & Y-Carriages. While doing so, squeeze the Nut-Blocks together to remove any backlash.

Step 10 — Y-Axis Alignment

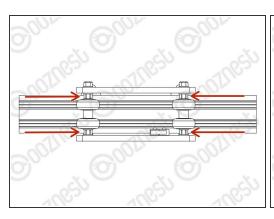

- Home the machine.
 - Then turn the machine off.
 - On the left Y-Axis (The side with the Limit-Switch) measure the distance between the back of the Y-Carriage and Y-End-Plate.
 - On right Y-Axis measure the same distance.
 - Rotate the Flexible-Coupler by hand until it matches the left Y-Axis.

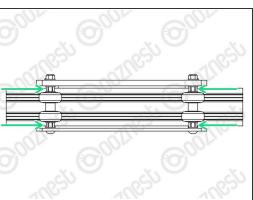

Step 11 — Lead Screw Caps

 Using 12 x M5-Button-Head-Bolt-16mm attach 3 x Lead-Screw-Caps over the bare ends of the X & Y-Axis Lead-Screws.

Step 12 — Eccentric Spacers

- (i) In the 'Extras' box there is an Eccentric-Spacer-Spanner.
 - This is shaped to give you access to all the Eccentric-Spacer-6mms without needing to move your machine.
- (i) Eccentric-Spacer-6mms should be adjusted until there is a small amount of friction between the Solid-Wheel & Extrusion.
 - (i) Check there is also no play in the carriage if you try to wobble it. The Eccentric-Spacer-6mm will remove this if adjusted correctly.
- Adjust the Eccentric-Spacers on the X-Carriage.
- Adjust the Eccentric-Spacers on both Y-Carriages.
- Adjust the Eccentric-Spacers on the Z-Axis.
- (i) We recommend periodically checking the Eccentric-Spacer-6mms throughout the use of the machine.

Step 13 — Guide Complete

- it is nice to finally start moving the machine!
 - Guide Complete Proceed to <u>3.</u>
 <u>Spoilerboard</u>

Thanks for following the guide. Testing of the WorkBee is now complete!
